

EVIDENCE LOCKER

Solution Presentation

A secure, auditable workspace for turning cyber-fraud incidents into structured complaint and evidence packages.

Cyber-fraud complaint support platform for India

Current product implementation

The challenge

Cyber-fraud reporting is fragmented, time-sensitive, and evidence-heavy.

Victims must often reconstruct events across phones, banking apps, messages, email, social platforms, and paper records. Support teams and reviewers then need enough context to understand what happened, what the files show, and how those files were handled.

Fragmented stories

Important facts are spread across channels, making timelines and narratives difficult to assemble.

Weak evidence context

Files may lack source, capture time, transaction references, or a clear explanation of relevance.

Slow handoffs

Incomplete packages create avoidable clarification cycles between victims, helpers, and authorities.

The opportunity

Create one trusted workflow that connects the incident narrative, supporting evidence, integrity information, custody history, and next action.

The solution

Evidence Locker turns an incident into a reviewable complaint package.

Capture

Guided complaint forms collect victim, location, incident, and fraud-specific facts.

Preserve

Evidence files are validated, stored, hashed, and linked to the complaint.

Explain

Metadata and manual context show what each file is, where it came from, and why it matters.

Collaborate

Role-aware access supports victims, helpers, police reviewers, and administrators.

Handoff

Status, remarks, receiving unit, officer, and custody events make transitions visible.

Package

A structured PDF packet brings the complaint and evidence record together.

How it works

A clear path from first report to submission-ready documentation.

Outcome: a consistent complaint record with traceable evidence context and a visible chain of custody.

Who benefits

One shared workflow, with permissions and views appropriate to each role.

Victim

Documents the incident, uploads evidence, and tracks progress.

Support / NGO

Helps prepare the complaint and improve evidence context.

Police reviewer

Reviews submissions, requests clarification, and records decisions.

Administrator

Oversees policies, audit records, users, and access.

Shared value

● Victims

Less fragmented documentation and clearer next steps.

● Support teams

Less duplicate entry and more traceable assistance.

● Reviewers

More consistent packages with evidence references and integrity details.

● Administrators

Operational visibility across access, status, and audit activity.

Trust by design

Controls support confidentiality, integrity, accountability, and safe handling.

Authentication

OTP-based login and JWT sessions establish controlled access.

Authorization

Role-based permissions restrict actions and complaint visibility.

Confidentiality

Sensitive complaint contact fields are encrypted at rest.

Integrity

SHA-256 hashes make post-upload file changes detectable.

Accountability

Audit logs record authentication, complaint, and evidence actions.

Input controls

File types, file counts, and upload size are validated.

Important: a post-upload hash supports integrity after hashing and storage; it does not prove pre-upload originality.

Technology foundation

A modular web platform with evidence and document services.

Frontend	React + Vite + React Router + Tailwind CSS
API services	Node.js + Express route modules for auth, complaints, evidence, audit, jurisdiction, and chat
Data layer	MongoDB + Mongoose models for users, complaints, evidence, sessions, OTP, and audit logs
Evidence services	Multer validation + GridFS storage + exifr metadata extraction + SHA-256 hashing
Document services	pdf-lib package generation with complaint summary, evidence vault, custody table, and attestation draft

Designed for extension

The separation of frontend, API routes, models, evidence utilities, and PDF generation provides a practical base for web, mobile, and future integrations.

The value proposition

Better preparation and traceability before official processes begin.

Evidence Locker is a preparation and documentation layer. It helps people present clearer facts, preserve evidence context, and make handoffs auditable.

It does not replace police, cyber-cell, banking, legal, or judicial processes. Acceptance, investigation, recovery, and conviction remain decisions of the relevant authorities.

Positioning statement

A secure, auditable, and user-centered workspace for turning cyber-fraud incidents into structured complaint and evidence packages.

Thank you

Evidence Locker | Solution Presentation

AI chatbot assistance

Guidance that improves documentation without replacing human or official review.

Understand

Explains digital incidents in simple language and asks relevant follow-up questions.

Organize

Helps build timelines and prepare factual incident-report drafts from user-provided facts.

Use context

Can reference authorized incident evidence metadata, not the underlying files.

Stay safe

Never asks for passwords, OTPs, private keys, or API keys; does not fabricate or authenticate evidence.

Boundary

The chatbot is an information and documentation assistant—not a lawyer, police officer, investigator, forensic examiner, or emergency service. AI output must be verified against the original facts and evidence.
